

## What are VOCs anyway?

VOCs (Volatile Organic Compounds) can be injurious to health, carcinogenic and environmentally destructive. The solvent or UV inks most commonly used in wide format printing “outgas” emitting VOCs, even after they’re supposedly “dry.” Water-based inks (the kind that EcoVisual uses for large format output) are better for the environment, emit no VOCs, are easier to recycle and safer for common uses. Why expose workers, users or anyone to potentially dangerous VOCs when you don’t have to?
